BACKGROUND OF THE INVENTION

5

10

15

30

၁၂၁

12)

where

MV is the motion vector of the P-block.

MV_F and MV_B are the forward and backward motion vectors for the B-block.

TR_B is the increment in the temporal reference from the last P-frame to the current B-frame, and

TR_P is the increment in the temporal reference from the last P-frame to the current P-frame.

Currently the method used in the prior art assumes a linear motion model. However this assumption is not valid in a normal scene where the motion is typically not linear. This is especially true when the camera shakes and when objects are not moving at constant velocities.

A second problem involves the quantization and transmission of the residual of the prediction error in the B-block. Currently the coefficients from the P-block and the B-block are interleaved in some scanning order which requires the B-block coefficients to be transmitted even when they are all zero. This is not very efficient as it is quite often that there are no residual coefficients to transmit (all coefficients are zero).

SUMMARY OF THE INVENTION

In order to solve the first problem, the current invention employs a delta motion vector to compensate for the non-linear motion. Thus it becomes necessary for the encoder to perform an additional motion search to obtain the optimum delta motion vector that when added to the derived motion vectors would result in the best match in the prediction. This delta motion vectors are transmitted to the decoder at the block level only when necessary. A flag is used to indicate to the decoder if there are delta motion vectors present for the B-block.

For the second problem, this invention also uses a flag to indicate if there are coefficients for the B-block to be decoded.

The operation of the Invention is described as follows.

FIG. 3a shows the linear motion model used for the derivation of the forward and backward motion vectors from the P-block motion vector and the temporal reference information. As illustrated in FIG. 3b, this model breaks down when the motion is not linear. The derived forward and backward motion vector is different from the actual motion vector when the motion is not linear. This is especially true when objects in the scene are moving at changing velocities.

In the current invention the problem is solved by adding a small delta motion vector to the derived motion vector to compensate for the difference between the derived and true motion vector. Therefore the equations in (1) and (2) are now replaced by equations (3) and (4), respectively.

$$MV_F' = TR_B \times MV_VTR_P - MV_{Delta} \quad (3)$$

$$MV_B' = (TR_B - TR_P) \times MV_VTR_P - MV_{Delta} \quad (4)$$

where

MV' is the motion vector of the P-block.

MV_{Delta} is the delta motion vector.

MV_F' and MV_B' are the new forward and backward motion vectors for the B-block according to the current invention.

TR_B is the increment in the temporal reference from the last P-frame to the current B-frame, and

TR_P is the increment in the temporal reference from the last P-frame to the current P-frame.

09691858-10100

Note: Equations (3) and (4) are used for the motion vector in the horizontal as well as the vertical directions. Thus the motion vectors are in pairs and there are actually two independent delta motion vectors, one each for the horizontal and vertical directions. 5

BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 1a is a prior art which illustrates the prediction mode used in the ITU-T Recommendation H.261 Standard. 10

FIG. 1b is a prior art which illustrates the prediction mode used in the ISO-IEC/JTC MPEG Standard.

FIG. 2a illustrates the PB-frame prediction mode.

FIG. 2b illustrates the B-block bi-directional prediction mode. 15

FIG. 3a illustrates the linear motion model.

FIG. 3b illustrates the non-linear motion model of the current invention

FIG. 4 illustrates the encoder functionality block diagram. 20

FIG. 5 illustrates the B-block bi-directional prediction functionality block diagram.

FIG. 6 illustrates the decoder functionality block diagram. 25

PREFERRED EMBODIMENTS

The preferred embodiment of the current invention is described here. FIG. 4 illustrates the encoding functionality diagram. The present invention deals with the method for deriving the motion vectors for the B-block. The encoding functionality is presented here for completeness of the embodiment. 30

The encoding functionality block diagram depicts an encoder using a motion estimation and compensation for reducing the temporal redundancy in the sequence to be coded. The input sequences is organized into a first frame and pairs of subsequent frames. The first frame, hereafter referred to as the I-frame, is coded independent of all other frames. The pairs of subsequent frames, hereafter referred to as PB-frame, consist of a B-frame followed by a P-frame. The P-frame is forward predicted based on the previously reconstructed I-frame or P-frame and the B-frame is bi-directionally predicted based on the previously reconstructed I-frame or P-frame and the information in the current P-frame. 35

The input frame image sequence, 1, is placed in the Frame Memory 2. If the frame is classified as an I-frame or a P-frame it is passed through line 14 to the Reference Memory 3, for use as the reference frame in the motion estimation of the next PB-frame to be predictively encoded. The signal is then passed through line 13 to the Block Sampling module 4, where it is partitioned into spatially non-overlapping blocks of pixel data for further processing. 40

If the frame is classified as an I-frame, the sampled blocks are passed through line 16 to the DCT module 7. If the frame is classified as a PB-frame, the sampled blocks are passed through line 17 to the Motion Estimation module 5. The Motion Estimation module 5 uses information from the Reference Frame Memory 3 and the current block 17 to obtain the motion vector for that provides the best match for the P-block. The motion vector and the local reconstructed frame, 12, are passed through line 19 and 20, respectively, to the Motion Compensation module 6. The difference image is formed by subtracting the motion compensated decoded frame, 21, from the current P-block, 15. This signal is then passed through line 22 to the DCT module 7. 45

00691858 104300

In the DCT module 7, each block is transformed into the DCT domain coefficients. The transform coefficients are passed through line 23 to Quantization module 8, where they are quantized. The quantized coefficients are then passed through line 24 to the Run-length & Variable Length Coding module 9. Here the coefficients are entropy coded to form the Output Bit Stream. 25.

If the current block is an I-block or a P-block, the quantized coefficients are also passed through line 26 to the Inverse Quantization module 10. The output of the Inverse Quantization 10, is then passed through line 27 to the Inverse DCT module 11. If the current block is an I-block then the reconstructed block is placed, via line 28, in the Local Decoded Frame Memory 12. If the current block is a P-block then the output of the Inverse DCT 29 is added to the motion compensated output 21, to form the reconstructed block 30. The reconstructed block 30, is then placed in the Local Decoded Frame Memory 12, for the motion compensation of the subsequent frames.

After the P-block have been locally reconstructed, the information is passed again to the Motion Compensation Module 6, where the prediction of the B-block is formed. FIG. 5 shows a more detailed functional diagram for the B-block prediction process. The P-motion vector derived in the Motion Estimation module 51, is passed through line 57 to the Motion Vector Scaling Module 53. Here the forward and backward motion vectors of the B-block is derived using the formula (1) and (2), respectively. In the present embodiment, an additional motion search around these vectors is performed in the Delta Motion Search module 54, to obtain the delta motion vector. In this embodiment the motion vector is obtained by performing the search for all delta motion vector values between -3 and 3. The delta motion vector value that gives the best prediction in terms of the smallest mean absolute difference in the pixel values of the B-block and the prediction block is chosen. The prediction is formed in the Bi-directional Motion Compensation module 55, according to FIG. 2b using the information from the Local Decoded Frame Memory 52, and the Current Reconstructed P-block 50. In the bi-directional prediction, only information available in the corresponding P-block is used to predict the B-block. The average of the P-block information and the information from the Local Decoded Frame is used to predict the B-block. The rest of the B-block is predicted using information from the Local Decoded Frame only.

The prediction difference block is then passed through line 22 to the DCT module 7. The DCT coefficients are then passed through line 23 to the Quantization module 8. The result of the Quantization module 8, is passed through line 24 to the Run-length & Variable Length Coding 9. In this module the presence of the delta motion vector and the quantized residual error in the Output Bitstream 25, is indicated a variable length code, NOB which is the acronym for No B-block This flag is generated in Run-length & Variable Length Coding module 9 based on whether there are residual error in the Quantization module 8 and delta motion vectors found in the Delta Motion Search module 54 is not zero. Table 1 provides the preferred embodiment of the variable length code for the NOB flag. The variable length code of the NOB flag is inserted in the Output Bitstream. 25, prior to the delta motion vector and quantized residual error codes.

TABLE I

| (Variable length code for the NOB flag) | | | 5 |
|---|-----------------------------------|-------------------------------|----|
| NOB | Quantized Residual Error Coded | Delta Motion Vectors Coded | |
| 0 | No | No | 10 |
| 10 | No | Yes | |
| 110 | Yes | No | |
| 111 | Yes | Yes | |

FIG. 6 shows the functional block diagram for the decoder. The Input Bit Stream 31. is passed to the Variable Length & Run Length Decoding module 32. The block and side information are extracted in this module. If the frame is a PB-frame then the bitstream is checked if any delta motion vector and/or quantized residual error coefficients present. The output of the module 32. is passed through line 37 to the Inverse Quantisation module 33. The output of the Inverse Quantization 33. is then passed through line 38 to the Inverse DCT module 34. Here the coefficients are transformed back into the pixel values.

If the current frame is an I-frame then the output of Inverse DCT 34. is passed through line 39 and stored in the Frame Memory 42.

If the current frame is a PB-frame, the side information containing the motion vectors are passed through line 45 to the Motion compensation module 36. The motion Compensation module 36. uses this information and the information in the Local Decoded Memory. 35. to form the motion compensated signal. 44. This signal is then added to the output of the Inverse DCT module 34. to form the reconstruction of the P-block.

The Motion Compensation module 36. then uses the additional information obtained in the reconstructed P-block to obtain the bi-directional prediction for the B-block. The B-block is then reconstructed and placed in the Frame Memory. 42. together with the P-block.

By implementing this invention, the temporal frame rate of the decoded sequences can be effectively doubled at a fraction of the expected cost in bit rate. The delay is similar to that of the same sequence decoded at half the frame rate.

As described above in the present invention a new predictive coding is used to increase the temporal frame rate and coding efficiency without introducing excessive delay. Currently the motion vector for the blocks in the bi-directionally predicted frame is derived from the motion vector of the corresponding block in the forward predicted frame using a linear motion model. This however is not effective when the motion in the image sequence is not linear. According to this invention, the efficiency of this method can be further improved if a non-linear motion model is used. In this model a delta motion vector is added to or subtracted from the derived forward and backward motion vector, respectively. The encoder performs an additional search to determine if there is a need for the delta motion vector. The presence of this delta motion vector in the transmitted bitstream is signalled to the decoder which then takes the appropriate action to make use of the delta motion vector to derive the effective forward and backward motion vectors for the bi-directionally predicted block.

What is claimed:

1. A method for encoding a sequence of video image frames comprising the steps of:
 - dividing a source sequence into a set of group of pictures.
 - each group of pictures comprising a first frame

(I-frame) followed by a plurality of pairs of predictively encoded frames (PB-frame pairs), each PB-frame pair having a corresponding P-block:

5 dividing each I-frame or PB-frame pair into a plurality of spatially non-overlapping blocks of pixel data:

encoding the blocks from the I-frame (I-blocks) independently from any other frames in the group of pictures;

10 predictively encoding the blocks from the second frame of the PB-frame pair (P-blocks), based on the I-blocks in the previous I-frame or the P-blocks in the previous PB-frame pair:

15 bi-directionally predictively encoding the blocks from the first frame of the PB-frame pair (B-blocks), based on the I-blocks in the previous I-frame or the P-blocks in the previous PB-frame pair and the corresponding P-block in the current PB-frame pair:

20 deriving a scaled forward motion vector and a scaled backward motion vector for the B-block by scaling the motion vector of the corresponding P-block in the current PB-frame pair:

obtaining a final forward motion vector for the B-block by adding a delta motion vector to the scaled forward motion vector; and

25 obtaining a final backward motion vector for the B-block by subtracting the delta motion vector from the scaled backward motion vector.

2. A method for encoding a sequence of video image frames according to claim 1, wherein

30 the scaling of the motion vector is based on a temporal reference of the first and second frames of the PB-frame pair.

3. A method for encoding a sequence of video image frames according to claim 1, further comprising the step of forming an encoded output, wherein the encoded output is a bitstream comprising:

temporal reference information for the first and second frames of the PB-frame pairs:

40 motion vector information for the P-blocks:

quantized residual error information for the P-blocks:

delta motion vector information for the B-blocks; and

quantized residual error information for the B-blocks.

45 4. A method for encoding a sequence of video image frames according to claim 3, wherein

the output bitstream contains additional information to indicate the presence of at least one of:

the delta motion vector information for the B-blocks; and

50 the quantized residual error information for the B-blocks.

5. A method for decoding a sequence of video image frames comprising the steps of:

55 decoding the compressed video image sequence as a set of group of pictures, each group of pictures comprising an I-frame followed by a plurality of PB-frame pairs, each PB-frame pair having a corresponding P-block:

decoding each I-frame or PB-frame pair into a plurality of spatially non-overlapping blocks of pixel data:

60 decoding the I-blocks from the I-frame independently from any other frames in the group of pictures:

predictively decoding the P-blocks from the second frame of the PB-frame pair based on the I-blocks in the previous I-frame or the P-blocks in the previous PB-frame pair:

65 bi-directionally predictively decoding the B-blocks from the first frame of the PB-frame pair based on the

09691858 101300

I-blocks in the previous I-frame or the P-blocks in the previous PB-frame pair and the corresponding P-block in the current PB-frame pair;

deriving a scaled forward motion vector and a scaled backward motion vector for the B-block by scaling the motion vector of the corresponding P-block in the current PB-frame pair;

obtaining a final forward motion vector for the B-block by adding a delta motion vector to the scaled forward motion vector; and

obtaining a final backward motion vector for the B-block by subtracting the delta motion vector from the scaled backward motion vector.

6. A method for decoding a sequence of video image frames according to claim 5, further comprising the step of forming a decoded output, wherein the decoded output is responsive to a bitstream comprising:

temporal reference information for the first and second frames of the PB-frame pairs;

motion vector information for the P-blocks;

quantized residual error information for the P-blocks;

the delta motion vector information for the B-blocks; and

quantized residual error information for the B-blocks.

7. A method for decoding a sequence of video image frames according to claim 6, wherein

the bitstream contains additional information to indicate the presence of at least one of:

the delta motion vector information for the B-blocks; and

the quantized residual error information for the B-blocks.

8. A method of decoding a sequence of video image frames according to claim 5, wherein

the scaling is based on a temporal reference of the first and second frames of the PB-frame pair.

9. An apparatus for encoding a sequence of video image frames comprising:

means for encoding each frame in a sequence of video image frames into a set of group of pictures, each group of pictures comprising an I-frame followed by a plurality of PB-frame pairs;

means for dividing the I-frame and the PB-frame pair into a plurality of spatially non-overlapping blocks of pixel data;

means for encoding and decoding the I-blocks of the I-frame independently from any other frames in the group of pictures;

means for storing the decoded I-blocks to predictively encode subsequent frames;

means for predictively encoding and decoding the P-blocks of the second frame of the PB-frame pair based on the I-blocks in the previous I-frame or the P-blocks in the previous PB-frame pair;

means for storing the decoded P-blocks to predictively encode subsequent frames;

means for deriving a scaled forward motion vector and a scaled backward motion vector for a B-block by scaling the motion vector of the corresponding P-block in the current PB-frame pair, the B-block being the first frame of the PB-frame pair;

means for obtaining a final forward motion vector for the B-block by adding a delta motion vector to the scaled forward motion vector;

means for obtaining a final backward motion vector for the B-block by subtracting the same delta motion vector from the scaled backward motion vector; and

5

1 13. A method for decoding a
 2 compressed video image sequence of a
 3 group of pictures including an I-frame
 4 followed by a plurality of P-frames and B-
 5 frames, comprising the steps of:

6 decoding a block in the I-
 7 frame independently from any other frames
 8 in the group of pictures;

9 predictively decoding a block
 10 in a P-frame based on the previous I-frame
 11 or a previous P-frame;

12 bi-directionally predictively
 13 decoding a block in a B-frame based on the
 14 previous I-frame or a previous P-frame and
 15 a block in a P-frame positioned after the B-
 16 frame;

17 deriving a scaled forward
 18 motion vector and a scaled backward motion
 19 vector for the block in the B-frame by
 20 scaling a motion vector of the block in the
 21 P-frame positioned after the B-frame;

22 obtaining a final forward
 23 motion vector for the block in the B-frame
 24 by adding a delta motion vector to the scaled
 25 forward motion vector; and

26 obtaining a final backward
27 motion vector for the block in the B-frame
28 by adding the delta motion vector to the
29 scaled backward motion vector.

1 14. A method of decoding a
2 sequence of video image frames according
3 to claim 13, wherein the deriving step
4 includes:

5 scaling of the forward and
6 backward motion vectors is based on a
7 temporal reference of the B-frame and the P-
8 frame.

1 15. A method for decoding a
2 sequence of video image frames according
3 to claim 13, further comprising the step of
4 forming a decoded output, wherein the
5 decoded output is responsive to a bitstream
6 comprising:

7 temporal reference
8 information for the B-frame and the P-
9 frame;

10 motion vector information for
11 the block in the P-frame;

12 quantized residual error
13 information for the block in the P-frame;

```

14         the delta motion vector
15         information for the block in the B-frame;
16         and

ABSTRACT

A new predictive coding is used to increase the temporal frame rate and coding efficiency without introducing excessive delay. Currently the motion vector for the blocks in the bi-directionally predicted frame is derived from the motion vector of the corresponding block in the forward predicted frame using a linear motion model. This however is not effective when the motion in the image sequence is not linear. The efficiency of this method can be further improved if a non-linear motion model is used. In this model a delta motion vector is added to or subtracted from the derived forward and backward motion vector, respectively. The encoder performs an additional search to determine if there is a need for the delta motion vector. The presence of this delta motion vector in the transmitted bitstream is signalled to the decoder which then takes the appropriate action to make use of the delta motion vector to derive the effective forward and backward motion vectors for the bi-directionally predicted block.

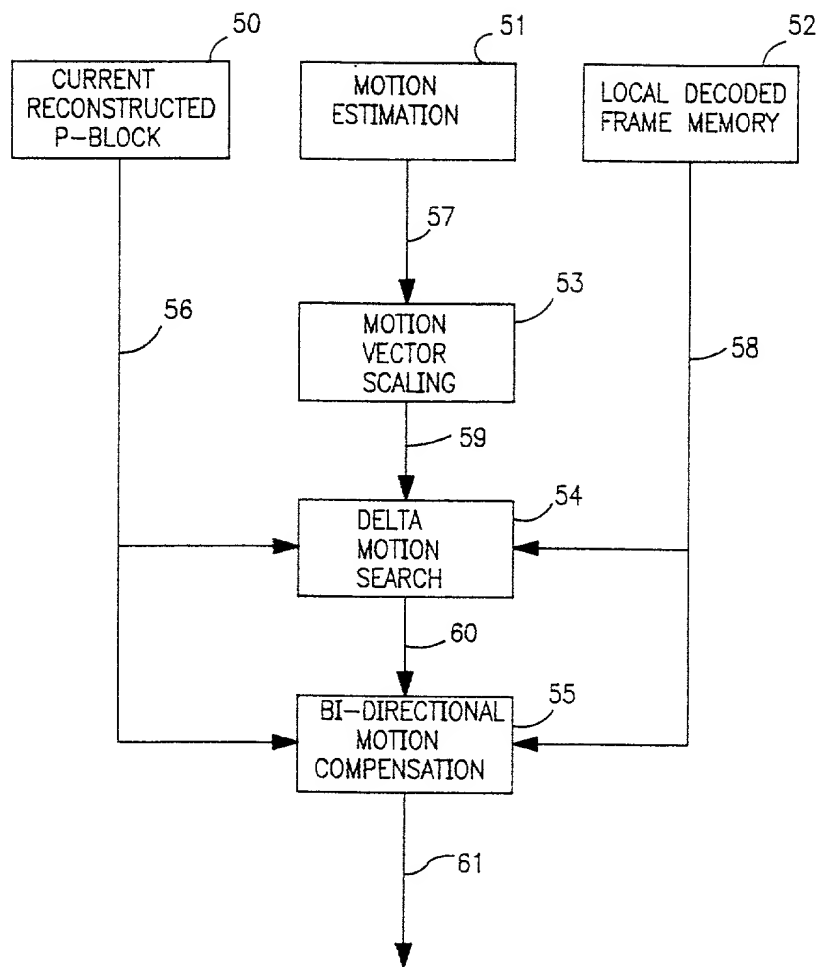

FIG. 5

REISSUE APPLICATION DECLARATION BY THE INVENTOR

Docket Number (Optional)

MTS-880US2

As a below named inventor, I hereby declare that:

My residence, post office address and citizenship are stated below next to my name.

I believe I am the original, first and sole inventor (if only one name is listed below) or an original, first and joint inventor (if plural names are listed below) of the subject matter which is described and claimed in patent number 5,825,421, granted October 20, 1998, and for which a reissue patent is sought on the invention entitled VIDEO CODING METHOD AND DECODING METHOD AND

DEVICES THEREOF

the specification of which

☒ is attached hereto.

☐ was filed on _____ as reissue application number ____ / _____ and was amended on _____ (If applicable)

I have reviewed and understand the contents of the above identified specification, including the claims, as amended by any amendment referred to above.

I acknowledge the duty to disclose information which is material to patentability as defined in 37 CFR 1.56.

I verily believe the original patent to be wholly or partly inoperative or invalid, for the reasons described below. (Check all boxes that apply.)

- ☐ by reason of a defective specification or drawing.
- ☒ by reason of the patentee claiming more or less than he had the right to claim in the patent.
- ☐ by reason of other errors.

At least one error upon which reissue is based is described as follows:

During the prosecution of the application that issued as the above patent, the inventors did not recognize that the features disclosed in new claims 13-16 were appropriate to claim. As such, the inventors did not claim all that they had a right to claim. This error was made without deceptive intent.

[Page 1 of 2]

Burden Hour Statement: This form is estimated to take 0.5 hours to complete. Time will vary depending upon the needs of the individual case. Any comments on the amount of time you are required to complete this form should be sent to the Chief Information Officer, Patent and Trademark Office, Washington, DC 20231. DO NOT SEND FEES OR COMPLETED FORMS TO THIS ADDRESS. SEND TO: Assistant Commissioner for Patents, Washington, DC 20231.

0954058 101300

Under the Paperwork Reduction Act of 1995, no persons are required to respond to a collection of information unless it displays a valid OMB control number.

(REISSUE APPLICATION DECLARATION BY THE INVENTOR, page 2)

Docket Number (Optional)

MTS-880US2

All errors corrected in this reissue application arose without any deceptive intention on the part of the applicant. As a named inventor, I hereby appoint the following attorney(s) and/or agent(s) to prosecute this application and transact all business in the Patent and Trademark Office connected therewith.

S I R :

Matsushita Electric Industrial Co., Ltd., a Japanese Corporation certifies that it is the assignee of the entire right, title and interest in the patent application identified above by virtue of an assignment from the inventor of the patent application identified above. The assignment was recorded in the Patent and Trademark Office at Reel 8607, Frame 0024, for which a copy thereof is attached.

The undersigned has reviewed all the documents in the chain of title of the patent application identified above and, to the best of undersigned's knowledge and belief, title is in the assignee identified above.

The undersigned (whose title is supplied below) is empowered to act on behalf of the assignee.

I hereby declare that all statements made herein of my own knowledge are true, and that all statements made on information and belief are believed to be true; and further, that these statements are made with the knowledge that willful false statements, and the like so made, are punishable by

00691853-101900

fine or imprisonment, or both, under Section 1001, Title 18 of the United States Code and that such willful false statements may jeopardize the validity of the application or any patent issuing thereon.

ASSIGNMENT

WHEREAS, the ASSIGNOR, comprising the following named inventor(s)

Inventor(s)

ASSIGNOR(s)/
INVENTOR(s)

1. Tan, Thiew Keng 2. _____
3. _____ 4. _____

has made an invention entitled: _____

VIDEO CODING METHOD AND DECODING METHOD AND DEVICES THEREOF

and has executed an application for Letters Patent of the United States
concurrently herewith;

WHEREAS, the ASSIGNEE

Matsushita Electric Industrial Co., Ltd.

ASSIGNEE
(Full Name
and address)

of 1006, Oaza Kadoma, Kadoma-shi, Osaka 571 JAPAN

is desirous of acquiring the entire interest in and to said invention and the
Letters Patent to be obtained therefor,

NOW, THEREFORE, in consideration of the payment by ASSIGNEE to
ASSIGNOR of a sum corresponding to One Dollar (\$1.00), and for other good
and valuable consideration, the receipt of which is hereby acknowledged,
ASSIGNOR, intending to be legally bound, hereby sells, assigns and transfers
to ASSIGNEE, its successors and assigns the full and exclusive right, title and
interest in and to said invention, all applications for Letters Patent for said
invention, including all divisions and continuations thereof, all rights to claim
priority based thereon, and all Letters Patent, including reissues, to be obtained
therefor, including any and all foreign patent rights in this invention
corresponding thereto.

ASSIGNOR hereby warrants that no assignment, sale, agreement or
encumbrance has been or will be made or entered into which would conflict
with this Assignment.

ASSIGNOR agrees it shall be legally bound, upon request of the ASSIGNEE or its successors or assigns or a legal representative thereof, to supply all information and evidence of which the ASSIGNOR has knowledge or possession, relating to the making and practice of said invention, to testify in any legal proceeding relating thereto, to execute all instruments proper to patent the invention in the United States of America and foreign countries in the name of the ASSIGNEE, and to execute all instruments proper to carry out the intent of this instrument.

If the invention requires a biological deposit, ASSIGNOR also grants to ASSIGNEE such control over any deposit made by ASSIGNOR as may be necessary to the validity of the patent rights assigned herein.

ASSIGNOR authorizes ASSIGNOR's attorney to insert at the end hereof the serial number and filing date of the aforesaid application for United States Letters Patent and/or the Attorney docket or file designation for this application.

If the ASSIGNOR includes more than one individual, these obligations shall apply to these individuals both individually and collectively.

IN WITNESS WHEREOF, this Assignment is executed on the day indicated below.
